VULCAN INSTALLATION DETAILS

33 Apartments Condominium
in East Orange, New Jersey, USA

VULCAN MODEL & INSTALLATION AREA

Vulcan S10 Anti-Scale System is installed on the cold-water pipe system of the 33 apartment house in East Orange, New Jersey.

PURPOSE

Before the installation of the Vulcan S10 on the cold water pipe, descaling was required on a quarterly basis. It was noted that the water heaters were not functioning as efficiently as expected. This observation was made on a bi-monthly basis.

RESULTS

Following the installation of the Vulcan S10 nine months ago, no descale has been required. Following daily inspections, the heating systems are fully functional.

If you invest in city properties occupied by more than one family, you may encounter hard water issues. This is water containing calcium and dissolved limestone. Our business specialises in energy-saving water heaters, which are very sensitive to water quality.

My plumber told me that I was losing energy due to scale build-up. When I watched the hot water system being cleaned, I saw that the pipes were full of limescale deposits. Cleaning the heat exchanger improved the efficiency of the water-heating system.

I am really impressed with the Vulcan S10. After doing a lot of research, I wasn't convinced that water softeners were the answer. I opted for Vulcan's electronic anti-scaling technology.

I installed the Vulcan S10 around nine months ago and haven't needed to descale it since. I check the heating systems daily and they are working perfectly. They are running exactly as they were designed to. The installation process was really easy. The Vulcan S10 is the right size for my system and was installed by my electrician.

I'm really impressed with the Vulcan anti-scaling system. I would highly recommend it to anyone who owns a commercial or industrial facility. It will protect your investment in water-heating systems. I will be installing the Vulcan in my other facilities soon.

Sincerely, MSJ - President & Owner
